## 💡 Installation conditions

A clean, **dust-free garage**

An installation temperature **between +10 °C and +25 °C**

A table for laying the film and a second person to assist

**Carry out installation within 7 days of receipt**

## Preparing the equipment

### High-capacity sprayer (V0259)

- Prepare a first mix: two tablespoons per litre of water, spray on the clean bodywork and apply a piece of PPF film.
- If the PPF sticks too much, add more soapy solution.
- If the PPF slides after the first squeegee pass, add deionised water.

### Steam cleaner

Fill the tank with deionised water and allow it to heat up.

## Step 1: Deep Cleaning

💡 The most important step

### 1. Touchless pre-wash for removing heavy dirt

- Spray the vehicle with the Kärcher®.
- Apply a layer of car shampoo foam and leave for 5–10 minutes.
- Rinse with the Kärcher®.

### 2. Manual wash

- Prepare two buckets: one with shampoo, one with clean water to rinse the mitt.
- Wash the car using the wash mitt.
- Rinse the mitt in the rinse bucket.
- ⚠ Note: don't forget door edges, trims, and recesses.

### 3. Rinse with the Kärcher®

### 4. Chemical decontamination

- Iron remover: leave for 3 minutes, do not allow to dry, then rinse with the Kärcher®.
- Bug remover: leave for 3 minutes, do not allow to dry, then rinse.

### 5. Mechanical decontamination

- Lubricate the surface with a mix of soapy solution and water.
- Glide the clay bar over the lubricated surface.

### 6. Rinse with deionised water

### 7. Drying the bodywork

- Wipe with a lint-free microfibre cloth.
- Optional: use compressed air to blow water from gaps.

## Step 2: Interior cleaning before installing each section

1. **Degrease** the entire surface (main area and edges) using Surface Cleaner (V0276).
2. Go over the surface with the **steam cleaner**.
3. **Dry** using a lint-free microfibre cloth.
4. **Remove any remaining dust** with the drying pad (V0123).
5. **Spray the bodywork** with the soapy solution.

## Step 3: Installing the PPF Film

 **For PPF kit purchases:** remove the excess material on the part to be installed.

 **For PPF purchased by the metre:** cut the piece to the desired size, leaving a 10 cm margin.

1. **Remove the protective liner** from the adhesive side of the film (marked with a red dot).  
 Depending on the PPF model, there may be a second liner to remove.
2. **Spray the soapy solution** on both the adhesive side of the film and the car's surface.
3. **Position the film** (adhesive side down) on the panel, spray the soapy solution again over the film, **and push the liquid out** between the film and the bodywork using the squeegee (V0271 / V0272) from the centre outwards.
4. For complex shapes (e.g. bumpers), apply steam to the film and adjust the position by stretching and smoothing the PPF.
5. For non-kit installations (purchased by the metre), trim the excess film, leaving 5–6 mm for folding over the edges.
6. **Apply the edges** by spraying deionised water at room temperature (not from the steam cleaner) onto the area and pressing down with a clean lint-free microfibre cloth.

## Step 4: After installation

 **Allow the film to rest on the vehicle for at least 24 hours indoors.**

 **During the following 15 days:**

- Do not wash the vehicle.
- Do not use car wash rollers.
- Do not use high-pressure washing (e.g. Kärcher®).
